4.960.4.47 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> void std::unordered_multiset<_Value, _Hash, _Pred, _Alloc>::swap ( unordered_multiset<_Value, _Hash, _Pred, _Alloc> &__x ) [inline], [noexcept]`

Swaps data with another unordered\_multiset.

Parameters

|                  |                                                                |
|------------------|----------------------------------------------------------------|
| <code>__x</code> | An unordered_multiset of the same element and allocator types. |
|------------------|----------------------------------------------------------------|

This exchanges the elements between two sets in constant time. Note that the global std::swap() function is specialized such that std::swap(s1,s2) will feed to this function.

## 4.961.1 Detailed Description

```
template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>>>class std::unordered_set< _Value, _Hash, _Pred, _Alloc >
```

A standard container composed of unique keys (containing at most one of each key value) in which the elements' keys are the elements themselves.

## Template Parameters

|                     |                                                                                   |
|---------------------|-----------------------------------------------------------------------------------|
| <code>_Value</code> | Type of key objects.                                                              |
| <code>_Hash</code>  | Hashing function object type, defaults to <code>hash&lt;_Value&gt;</code> .       |
| <code>_Pred</code>  | Predicate function object type, defaults to <code>equal_to&lt;_Value&gt;</code> . |
| <code>_Alloc</code> | Allocator type, defaults to <code>allocator&lt;_Key&gt;</code> .                  |

Meets the requirements of a [container](#), and [unordered associative container](#)

Base is `_Hashtable`, dispatched at compile time via template alias `__uset_hashtable`.

#### 4.961.3 Constructor & Destructor Documentation

```
4.961.3.1 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
 std::allocator<_Value>>> std::unordered_set< _Value, _Hash, _Pred, _Alloc >::unordered_set (size_type __n
 = 10, const hasher & __hf = hasher(), const key_equal & __eqf = key_equal(), const allocator_type & __a =
 allocator_type()) [inline], [explicit]
```

Default constructor creates no elements.

Parameters

|                    |                            |
|--------------------|----------------------------|
| <code>__n</code>   | Initial number of buckets. |
| <code>__hf</code>  | A hash functor.            |
| <code>__eqf</code> | A key equality functor.    |
| <code>__a</code>   | An allocator object.       |

Definition at line 132 of file unordered\_set.h.

```
4.961.3.2 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
 std::allocator<_Value>>> template<typename _InputIterator > std::unordered_set< _Value, _Hash, _Pred, _Alloc

 const key_equal & __eqf = key_equal(), const allocator_type & __a = allocator_type()) [inline]
```

Builds an unordered\_set from a range.

## Parameters

|                      |                                    |
|----------------------|------------------------------------|
| <code>__first</code> | An input iterator.                 |
| <code>__last</code>  | An input iterator.                 |
| <code>__n</code>     | Minimal initial number of buckets. |
| <code>__hf</code>    | A hash functor.                    |
| <code>__eqf</code>   | A key equality functor.            |
| <code>__a</code>     | An allocator object.               |

Create an `unordered_set` consisting of copies of the elements from `[__first,__last)`. This is linear in N (where N is `distance(__first,__last)`).

Definition at line 153 of file `unordered_set.h`.

```
4.961.3.3 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> std::unordered_set<_Value, _Hash, _Pred, _Alloc >::unordered_set (const
unordered_set<_Value, _Hash, _Pred, _Alloc > &) [default]
```

Copy constructor.

```
4.961.3.4 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> std::unordered_set<_Value, _Hash, _Pred, _Alloc >::unordered_set (
unordered_set<_Value, _Hash, _Pred, _Alloc > &&) [default]
```

Move constructor.

```
4.961.3.5 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> std::unordered_set<_Value, _Hash, _Pred, _Alloc >::unordered_set (const
allocator_type & __a) [inline],[explicit]
```

Creates an `unordered_set` with no elements.

## Parameters

|                  |                      |
|------------------|----------------------|
| <code>__a</code> | An allocator object. |
|------------------|----------------------|

Definition at line 172 of file `unordered_set.h`.

```
4.961.3.6 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> std::unordered_set<_Value, _Hash, _Pred, _Alloc >::unordered_set (
initializer_list<value_type> __l, size_type __n = 0, const hasher & __hf = hasher(), const key_equal &
__eqf = key_equal(), const allocator_type & __a = allocator_type()) [inline]
```

Builds an `unordered_set` from an `initializer_list`.

## Parameters

|                    |                                    |
|--------------------|------------------------------------|
| <code>__l</code>   | An <code>initializer_list</code> . |
| <code>__n</code>   | Minimal initial number of buckets. |
| <code>__hf</code>  | A hash functor.                    |
| <code>__eqf</code> | A key equality functor.            |
| <code>__a</code>   | An allocator object.               |

Create an `unordered_set` consisting of copies of the elements in the list. This is linear in N (where N is `__l.size()`).

Definition at line 207 of file `unordered_set.h`.

## 4.961.4 Member Function Documentation

4.961.4.1 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc>::begin ( ) [inline], [noexcept]`

Returns a read-only (constant) iterator that points to the first element in the `unordered_set`.

Definition at line 272 of file `unordered_set.h`.

4.961.4.2 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> const_iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc>::begin ( ) const [inline], [noexcept]`

Returns a read-only (constant) iterator that points to the first element in the `unordered_set`.

Definition at line 276 of file `unordered_set.h`.

4.961.4.3 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> local_iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc>::begin ( size_type __n ) [inline]`

Returns a read-only (constant) iterator pointing to the first bucket element.

Parameters

|                  |                   |
|------------------|-------------------|
| <code>__n</code> | The bucket index. |
|------------------|-------------------|

Returns

A read-only local iterator.

Definition at line 623 of file `unordered_set.h`.

4.961.4.4 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> const_local_iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc>::begin ( size_type __n ) const [inline]`

Returns a read-only (constant) iterator pointing to the first bucket element.

Parameters

|                  |                   |
|------------------|-------------------|
| <code>__n</code> | The bucket index. |
|------------------|-------------------|

Returns

A read-only local iterator.

Definition at line 627 of file `unordered_set.h`.

4.961.4.5 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> size_type std::unordered_set<_Value, _Hash, _Pred, _Alloc>::bucket_count ( ) const [inline], [noexcept]`

Returns the number of buckets of the `unordered_set`.

Definition at line 589 of file `unordered_set.h`.

4.961.4.6 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> const_iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc>::cbegin ( ) const [inline], [noexcept]`

Returns a read-only (constant) iterator that points to the first element in the unordered\_set.

Definition at line 299 of file unordered\_set.h.

4.961.4.7 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> const_local_iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc>::cbegin ( size_type __n ) const [inline]`

Returns a read-only (constant) iterator pointing to the first bucket element.

Parameters

|                  |                   |
|------------------|-------------------|
| <code>__n</code> | The bucket index. |
|------------------|-------------------|

Returns

A read-only local iterator.

Definition at line 631 of file unordered\_set.h.

4.961.4.8 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> const_iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc>::cend ( ) const [inline], [noexcept]`

Returns a read-only (constant) iterator that points one past the last element in the unordered\_set.

Definition at line 307 of file unordered\_set.h.

4.961.4.9 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> const_local_iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc>::cend ( size_type __n ) const [inline]`

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

Parameters

|                  |                   |
|------------------|-------------------|
| <code>__n</code> | The bucket index. |
|------------------|-------------------|

Returns

A read-only local iterator.

Definition at line 651 of file unordered\_set.h.

4.961.4.10 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> void std::unordered_set<_Value, _Hash, _Pred, _Alloc>::clear ( ) [inline], [noexcept]`

Erases all elements in an unordered\_set. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 500 of file unordered\_set.h.

4.961.4.11 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =  
std::allocator<_Value>> size_type std::unordered_set<_Value, _Hash, _Pred, _Alloc>::count ( const  
key_type & __x ) const [inline]`

Finds the number of elements.

## Parameters

|                  |                     |
|------------------|---------------------|
| <code>__x</code> | Element to located. |
|------------------|---------------------|

## Returns

Number of elements with specified key.

This function only makes sense for unordered\_multisets; for unordered\_set the result will either be 0 (not present) or 1 (present).

Definition at line 564 of file unordered\_set.h.

```
4.961.4.12 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> template<typename... _Args> std::pair<iterator, bool> std::unordered_set<
_Value, _Hash, _Pred, _Alloc >::emplace (_Args &&... _args) [inline]
```

Attempts to build and insert an element into the unordered\_set.

## Parameters

|                     |                                        |
|---------------------|----------------------------------------|
| <code>__args</code> | Arguments used to generate an element. |
|---------------------|----------------------------------------|

## Returns

A pair, of which the first element is an iterator that points to the possibly inserted element, and the second is a bool that is true if the element was actually inserted.

This function attempts to build and insert an element into the unordered\_set. An unordered\_set relies on unique keys and thus an element is only inserted if it is not already present in the unordered\_set.

Insertion requires amortized constant time.

```
4.961.4.13 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> template<typename... _Args> iterator std::unordered_set< _Value, _Hash, _Pred,
_Alloc >::emplace_hint (const_iterator __pos, _Args &&... _args) [inline]
```

Attempts to insert an element into the unordered\_set.

## Parameters

|                     |                                                                               |
|---------------------|-------------------------------------------------------------------------------|
| <code>__pos</code>  | An iterator that serves as a hint as to where the element should be inserted. |
| <code>__args</code> | Arguments used to generate the element to be inserted.                        |

## Returns

An iterator that points to the element with key equivalent to the one generated from `__args` (may or may not be the element itself).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `emplace()` does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

std::allocator<_Value>> std::pair<iterator, iterator> std::unordered_set<_Value, _Hash, _Pred, _Alloc
>::equal_range(const key_type &__x) [inline]
```

Finds a subsequence matching given key.

**Parameters**

|                  |                    |
|------------------|--------------------|
| <code>__x</code> | Key to be located. |

 std::allocator<_Value>> iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc>::erase (const_iterator
 __position) [inline]
```

Erases an element from an `unordered_set`.

**Parameters**

|                         |                                                   |
|-------------------------|---------------------------------------------------|
| <code>__position</code> | An iterator pointing to the element to be erased. |
|-------------------------|---------------------------------------------------|

**Returns**

An iterator pointing to the element immediately following `__position` prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from an `unordered_set`. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

 std::allocator<_Value>> iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc>::erase (iterator __it)
 [inline]
```

Erases an element from an `unordered_set`.

## Parameters

|                         |                                                   |
|-------------------------|---------------------------------------------------|
| <code>__position</code> | An iterator pointing to the element to be erased. |
|-------------------------|---------------------------------------------------|

## Returns

 std::allocator<_Value>> size_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::erase (const
 key_type & __x) [inline]
```

Erases elements according to the provided key.

## Parameters

|                  |                              |
|------------------|------------------------------|
| <code>__x</code> | Key of element to be erased. |
|------------------|------------------------------|

## Returns

The number of elements erased.

This function erases all the elements located by the given key from an `unordered_set`. For an `unordered_set` the result of this function can only be 0 (not present) or 1 (present). Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

 std::allocator<_Value>> iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::erase (const_iterator
 __first, const_iterator __last) [inline]
```

Erases a `[__first, __last)` range of elements from an `unordered_set`.

## Parameters

|                      |                                                           |
|----------------------|-----------------------------------------------------------|
| <code>__first</code> | Iterator pointing to the start of the range to be erased. |
| <code>__last</code>  | Iterator pointing to the end of the range to be erased.   |

## Returns

The iterator `__last`.

This function erases a sequence of elements from an `unordered_set`. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

__x ) [inline]`

Tries to locate an element in an `unordered_set`.

## Parameters

|                  |                        |
|------------------|------------------------|
| <code>__x</code> | Element to be located. |
|------------------|------------------------|

## Returns

Iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end ( `end()` ) iterator.

```
4.961.4.29 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> std::pair<iterator, bool> std::unordered_set<_Value, _Hash, _Pred, _Alloc >::insert
(const value_type & __x) [inline]
```

Attempts to insert an element into the `unordered_set`.

**Parameters**

|                  |                         |
|------------------|-------------------------|
| <code>__x</code> | Element to be inserted. |
|------------------|-------------------------|

**Returns**

A pair, of which the first element is an iterator that points to the possibly inserted element, and the second is a bool that is true if the element was actually inserted.

This function attempts to insert an element into the `unordered_set`. An `unordered_set` relies on unique keys and thus an element is only inserted if it is not already present in the `unordered_set`.

 (value_type && __x) [inline]
```

Attempts to insert an element into the `unordered_set`.

**Parameters**

|                  |                         |
|------------------|-------------------------|
| <code>__x</code> | Element to be inserted. |
|------------------|-------------------------|

**Returns**

 __hint, const value_type & __x) [inline]
```

Attempts to insert an element into the `unordered_set`.

**Parameters**

|                     |                                                                               |
|---------------------|-------------------------------------------------------------------------------|
| <code>__hint</code> | An iterator that serves as a hint as to where the element should be inserted. |
| <code>__x</code>    | Element to be inserted.                                                       |

**Returns**

An iterator that points to the element with key of `__x` (may or may not be the element passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `insert()` does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

Unordered\_set list assignment operator.

Parameters

|                  |                      |
|------------------|----------------------|
| <code>__l</code> | An initializer_list. |
|------------------|----------------------|

This function fills an unordered\_set with copies of the elements in the initializer list `__l`.

Note that the assignment completely changes the unordered\_set and that the resulting unordered\_set's size is the same as the number of elements assigned. Old data may be lost.

May rehash the unordered\_set.

Parameters

|                  |                            |
|------------------|----------------------------|
| <code>__n</code> | The new number of buckets. |

#### 4.964.1 Detailed Description

`template<class _Tp>class std::valarray<_Tp>`

Smart array designed to support numeric processing.

A valarray is an array that provides constraints intended to allow for effective optimization of numeric array processing by reducing the aliasing that can result from pointer representations. It represents a one-dimensional array from which different multidimensional subsets can be accessed and modified.

#### 4.965.1 Detailed Description

`template<typename _Tp, typename _Alloc = std::allocator<_Tp>> class std::vector< _Tp, _Alloc >`

A standard container which offers fixed time access to individual elements in any order.

#### Template Parameters

|                     |                                                                 |
|---------------------|-----------------------------------------------------------------|
| <code>_Tp</code>    | Type of element.                                                |
| <code>_Alloc</code> | Allocator type, defaults to <code>allocator&lt;_Tp&gt;</code> . |

Meets the requirements of a [container](#), a [reversible container](#), and a [sequence](#), including the [optional sequence requirements](#) with the exception of `push_front` and `pop_front`.

In some terminology a vector can be described as a dynamic C-style array, it offers fast and efficient access to individual elements in any order and saves the user from worrying about memory and size allocation. Subscripting ( `[]` ) access is also provided as with C-style arrays.

#### 4.965.2 Constructor & Destructor Documentation

4.965.2.1 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::vector< _Tp, _Alloc >::vector ( )`  
`[inline], [noexcept]`

Creates a vector with no elements.

Definition at line 253 of file `stl_vector.h`.

4.965.2.2 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::vector< _Tp, _Alloc >::vector ( const`  
`allocator_type &__a ) [inline], [explicit], [noexcept]`

Creates a vector with no elements.

#### Parameters

|                  |                      |
|------------------|----------------------|
| <code>__a</code> | An allocator object. |
|------------------|----------------------|

Definition at line 264 of file `stl_vector.h`.

4.965.2.3 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::vector<_Tp, _Alloc>::vector ( size_type __n, const allocator_type & __a = allocator_type() ) [inline], [explicit]`

Creates a vector with default constructed elements.

Parameters

|                  |                                             |
|------------------|---------------------------------------------|
| <code>__n</code> | The number of elements to initially create. |
| <code>__a</code> | An allocator.                               |

This constructor fills the vector with `__n` default constructed elements.

Definition at line 277 of file `stl_vector.h`.

4.965.2.4 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::vector<_Tp, _Alloc>::vector ( size_type __n, const value_type & __value, const allocator_type & __a = allocator_type() ) [inline]`

Creates a vector with copies of an exemplar element.

Parameters

|                      |                                             |
|----------------------|---------------------------------------------|
| <code>__n</code>     | The number of elements to initially create. |
| <code>__value</code> | An element to copy.                         |
| <code>__a</code>     | An allocator.                               |

This constructor fills the vector with `__n` copies of `__value`.

Definition at line 289 of file `stl_vector.h`.

4.965.2.5 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::vector<_Tp, _Alloc>::vector ( const vector<_Tp, _Alloc> & __x ) [inline]`

Vector copy constructor.

Parameters

|                  |                                                    |
|------------------|----------------------------------------------------|
| <code>__x</code> | A vector of identical element and allocator types. |
|------------------|----------------------------------------------------|

The newly-created vector uses a copy of the allocation object used by `__x`. All the elements of `__x` are copied, but any extra memory in `__x` (for fast expansion) will not be copied.

Definition at line 318 of file `stl_vector.h`.

4.965.2.6 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::vector<_Tp, _Alloc>::vector ( vector<_Tp, _Alloc> && __x ) [inline], [noexcept]`

Vector move constructor.

Parameters

|                  |                                                    |
|------------------|----------------------------------------------------|
| <code>__x</code> | A vector of identical element and allocator types. |
|------------------|----------------------------------------------------|

The newly-created vector contains the exact contents of `__x`. The contents of `__x` are a valid, but unspecified vector.

Definition at line 335 of file `stl_vector.h`.

4.965.2.7 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::vector<_Tp, _Alloc>::vector ( const vector<_Tp, _Alloc> & __x, const allocator_type & __a ) [inline]`

Copy constructor with alternative allocator.

Definition at line 339 of file stl\_vector.h.

4.965.2.8 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::vector<_Tp, _Alloc>::vector ( vector<_Tp, _Alloc> && __rv, const allocator_type & __a ) [inline], [noexcept]`

Move constructor with alternative allocator.

Definition at line 348 of file stl\_vector.h.

4.965.2.9 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::vector<_Tp, _Alloc>::vector ( initializer_list<value_type> __l, const allocator_type & __a = allocator_type() ) [inline]`

Builds a vector from an initializer list.

Parameters

|                  |                      |
|------------------|----------------------|
| <code>__l</code> | An initializer_list. |
| <code>__a</code> | An allocator.        |

Create a vector consisting of copies of the elements in the initializer\_list `__l`.

This will call the element type's copy constructor N times (where N is `__l.size()`) and do no memory reallocation.

Definition at line 373 of file stl\_vector.h.

4.965.2.10 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> template<typename _InputIterator, typename = std::RequireInputIter<_InputIterator>> std::vector<_Tp, _Alloc>::vector ( _InputIterator __first, _InputIterator __last, const allocator_type & __a = allocator_type() ) [inline]`

Builds a vector from a range.

Parameters

|                      |                    |
|----------------------|--------------------|
| <code>__first</code> | An input iterator. |
| <code>__last</code>  | An input iterator. |
| <code>__a</code>     | An allocator.      |

Create a vector consisting of copies of the elements from `[first,last)`.

If the iterators are forward, bidirectional, or random-access, then this will call the elements' copy constructor N times (where N is `distance(first,last)`) and do no memory reallocation. But if only input iterators are used, then this will do at most 2N calls to the copy constructor, and logN memory reallocations.

Definition at line 401 of file stl\_vector.h.

4.965.2.11 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::vector<_Tp, _Alloc>::~~vector ( ) [inline], [noexcept]`

The dtor only erases the elements, and note that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

### 4.965.3 Member Function Documentation

4.965.3.1 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> template<typename _ForwardIterator> pointer std::vector<_Tp, _Alloc>::M_allocate_and_copy ( size_type __n, _ForwardIterator __first, _ForwardIterator __last ) [inline], [protected]`

Memory expansion handler. Uses the member allocation function to obtain *n* bytes of memory, and then copies `[first,last)` into it.

Definition at line 1215 of file `std_vector.h`.

4.965.3.2 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::vector< _Tp, _Alloc >::_M_range_check ( size_type __n ) const [inline], [protected]`

Safety check used only from `at()`.

Definition at line 800 of file `std_vector.h`.

Referenced by `std::vector< block_type, allocator_type >::at()`.

4.965.3.3 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::vector< _Tp, _Alloc >::assign ( size_type __n, const value_type & __val ) [inline]`

Assigns a given value to a vector.

Parameters

|                    |                                    |
|--------------------|------------------------------------|
| <code>__n</code>   | Number of elements to be assigned. |
| <code>__val</code> | Value to be assigned.              |

This function fills a vector with `__n` copies of the given value. Note that the assignment completely changes the vector and that the resulting vector's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 488 of file `std_vector.h`.

Referenced by `std::vector< block_type, allocator_type >::assign()`, and `std::vector< block_type, allocator_type >::operator=()`.

4.965.3.4 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> template<typename _InputIterator, typename = std::RequireInputIter<_InputIterator>> void std::vector< _Tp, _Alloc >::assign ( _InputIterator __first, _InputIterator __last ) [inline]`

Assigns a range to a vector.

Parameters

|                      |                    |
|----------------------|--------------------|
| <code>__first</code> | An input iterator. |
| <code>__last</code>  | An input iterator. |

This function fills a vector with copies of the elements in the range `[__first, __last)`.

Note that the assignment completely changes the vector and that the resulting vector's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 507 of file `std_vector.h`.

4.965.3.5 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::vector< _Tp, _Alloc >::assign ( initializer_list< value_type > __l ) [inline]`

Assigns an initializer list to a vector.

Parameters

|                  |                                    |
|------------------|------------------------------------|
| <code>__l</code> | An <code>initializer_list</code> . |
|------------------|------------------------------------|

This function fills a vector with copies of the elements in the initializer list `__l`.

Note that the assignment completely changes the vector and that the resulting vector's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 533 of file `std_vector.h`.

4.965.3.6 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> reference std::vector<_Tp, _Alloc>::at (`  
`size_type __n ) [inline]`

Provides access to the data contained in the vector.

**Parameters**

|                  |                                                             |
|------------------|-------------------------------------------------------------|
| <code>__n</code> | The index of the element for which data should be accessed. |
|------------------|-------------------------------------------------------------|

**Returns**

Read/write reference to data.

**Exceptions**

|                                |                                          |
|--------------------------------|------------------------------------------|
| <code>std::out_of_range</code> | If <code>__n</code> is an invalid index. |
|--------------------------------|------------------------------------------|

This function provides for safer data access. The parameter is first checked that it is in the range of the vector. The function throws `out_of_range` if the check fails.

Definition at line 822 of file `stl_vector.h`.

4.965.3.7 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reference std::vector<_Tp, _Alloc>::at (size_type __n) const [inline]`

Provides access to the data contained in the vector.

**Parameters**

|                  |                                                             |
|------------------|-------------------------------------------------------------|
| <code>__n</code> | The index of the element for which data should be accessed. |
|------------------|-------------------------------------------------------------|

**Returns**

Read-only (constant) reference to data.

**Exceptions**

|                                |                                          |
|--------------------------------|------------------------------------------|
| <code>std::out_of_range</code> | If <code>__n</code> is an invalid index. |
|--------------------------------|------------------------------------------|

This function provides for safer data access. The parameter is first checked that it is in the range of the vector. The function throws `out_of_range` if the check fails.

Definition at line 840 of file `stl_vector.h`.

4.965.3.8 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> reference std::vector<_Tp, _Alloc>::back ( ) [inline], [noexcept]`

Returns a read/write reference to the data at the last element of the vector.

Definition at line 867 of file `stl_vector.h`.

Referenced by `std::piecewise_constant_distribution<_RealType>::max()`, and `std::piecewise_linear_distribution<_RealType>::max()`.

4.965.3.9 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reference std::vector<_Tp, _Alloc>::back ( ) const [inline], [noexcept]`

Returns a read-only (constant) reference to the data at the last element of the vector.

Definition at line 875 of file `stl_vector.h`.

4.965.3.10 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::vector<_Tp, _Alloc>::begin ( ) [inline], [noexcept]`

Returns a read/write iterator that points to the first element in the vector. Iteration is done in ordinary element order.

Definition at line 547 of file `stl_vector.h`.

Referenced by std::vector< block\_type, allocator\_type >::crend(), std::vector< block\_type, allocator\_type >::empty(), std::vector< block\_type, allocator\_type >::front(), std::vector< block\_type, allocator\_type >::insert(), \_\_gnu\_parallel::multiseq\_partition(), \_\_gnu\_parallel::multiseq\_selection(), \_\_gnu\_parallel::multiway\_merge\_exact\_splitting(), std::operator<(), std::vector< \_Tp, \_Alloc >::operator=(), std::operator==( ), std::vector< block\_type, allocator\_type >::rend(), and std::vector< block\_type, allocator\_type >::vector().

**4.965.3.11** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_iterator std::vector< _Tp, _Alloc >::begin ( ) const [inline], [noexcept]`

Returns a read-only (constant) iterator that points to the first element in the vector. Iteration is done in ordinary element order.

Definition at line 556 of file stl\_vector.h.

**4.965.3.12** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> size_type std::vector< _Tp, _Alloc >::capacity ( ) const [inline], [noexcept]`

Returns the total number of elements that the vector can hold before needing to allocate more memory.

Definition at line 734 of file stl\_vector.h.

**4.965.3.13** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_iterator std::vector< _Tp, _Alloc >::cbegin ( ) const [inline], [noexcept]`

Returns a read-only (constant) iterator that points to the first element in the vector. Iteration is done in ordinary element order.

Definition at line 620 of file stl\_vector.h.

Referenced by std::vector< block\_type, allocator\_type >::insert().

**4.965.3.14** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_iterator std::vector< _Tp, _Alloc >::cend ( ) const [inline], [noexcept]`

Returns a read-only (constant) iterator that points one past the last element in the vector. Iteration is done in ordinary element order.

Definition at line 629 of file stl\_vector.h.

**4.965.3.15** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::vector< _Tp, _Alloc >::clear ( ) [inline], [noexcept]`

Erases all the elements. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1205 of file stl\_vector.h.

**4.965.3.16** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reverse_iterator std::vector< _Tp, _Alloc >::crbegin ( ) const [inline], [noexcept]`

Returns a read-only (constant) reverse iterator that points to the last element in the vector. Iteration is done in reverse element order.

Definition at line 638 of file stl\_vector.h.

**4.965.3.17** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reverse_iterator std::vector< _Tp, _Alloc >::crend ( ) const [inline], [noexcept]`

Returns a read-only (constant) reverse iterator that points to one before the first element in the vector. Iteration is done in reverse element order.

Definition at line 647 of file `stl_vector.h`.

**4.965.3.18** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> _Tp* std::vector<_Tp, _Alloc>::data ( )`  
`[inline], [noexcept]`

Returns a pointer such that `[data(), data() + size())` is a valid range. For a non-empty vector, `data() == &front()`.

Definition at line 890 of file `stl_vector.h`.

Referenced by `std::regex_traits<_Ch_type>::transform_primary()`.

**4.965.3.19** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> template<typename... _Args> iterator`  
`std::vector<_Tp, _Alloc>::emplace ( const_iterator __position, _Args &&... __args )`

Inserts an object in vector before specified iterator.

#### Parameters

|                         |                                                |
|-------------------------|------------------------------------------------|
| <code>__position</code> | A <code>const_iterator</code> into the vector. |
| <code>__args</code>     | Arguments.                                     |

#### Returns

An iterator that points to the inserted data.

This function will insert an object of type `T` constructed with `T(std::forward<Args>(args)...) before the specified location`. Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using `std::list`.

Referenced by `std::vector< block_type, allocator_type >::insert()`.

**4.965.3.20** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> bool std::vector<_Tp, _Alloc>::empty ( )`  
`const [inline], [noexcept]`

Returns true if the vector is empty. (Thus `begin()` would equal `end()`.)

Definition at line 743 of file `stl_vector.h`.

Referenced by `std::piecewise_constant_distribution<_RealType>::densities()`, `std::piecewise_linear_distribution<_RealType>::densities()`, `std::piecewise_constant_distribution<_RealType>::intervals()`, `std::piecewise_linear_distribution<_RealType>::intervals()`, `std::discrete_distribution<_IntType>::max()`, `std::piecewise_constant_distribution<_RealType>::max()`, `std::piecewise_linear_distribution<_RealType>::max()`, `std::piecewise_constant_distribution<_RealType>::min()`, `std::piecewise_linear_distribution<_RealType>::min()`, and `std::discrete_distribution<_IntType>::probabilities()`.

**4.965.3.21** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::vector<_Tp, _Alloc>::end ( )`  
`[inline], [noexcept]`

Returns a read/write iterator that points one past the last element in the vector. Iteration is done in ordinary element order.

Definition at line 565 of file `stl_vector.h`.

Referenced by `std::vector< block_type, allocator_type >::back()`, `std::vector< block_type, allocator_type >::cbegin()`, `std::vector< block_type, allocator_type >::empty()`, `__gnu_parallel::multiseq_partition()`, `__gnu_parallel::multiseq_selection()`, `__gnu_parallel::multiway_merge_exact_splitting()`, `std::operator<()`, `std::vector<_Tp, _Alloc>::operator=()`, `std::operator==( )`, `std::vector< block_type, allocator_type >::push_back()`, `std::vector< block_type, allocator_type >::rbegin()`, `std::vector< block_type, allocator_type >::resize()`, and `std::vector< block_type, allocator_type >::vector()`.

4.965.3.22 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_iterator std::vector< _Tp, _Alloc >::end ( ) const [inline], [noexcept]`

Returns a read-only (constant) iterator that points one past the last element in the vector. Iteration is done in ordinary element order.

Definition at line 574 of file `stl_vector.h`.

4.965.3.23 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::vector< _Tp, _Alloc >::erase ( const_iterator __position ) [inline]`

Remove element at given position.

#### Parameters

|                         |                                            |
|-------------------------|--------------------------------------------|
| <code>__position</code> | Iterator pointing to element to be erased. |
|-------------------------|--------------------------------------------|

#### Returns

An iterator pointing to the next element (or `end()`).

This function will erase the element at the given position and thus shorten the vector by one.

Note This operation could be expensive and if it is frequently used the user should consider using `std::list`. The user is also cautioned that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1146 of file `stl_vector.h`.

4.965.3.24 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::vector< _Tp, _Alloc >::erase ( const_iterator __first, const_iterator __last ) [inline]`

Remove a range of elements.

#### Parameters

|                      |                                                              |
|----------------------|--------------------------------------------------------------|
| <code>__first</code> | Iterator pointing to the first element to be erased.         |
| <code>__last</code>  | Iterator pointing to one past the last element to be erased. |

#### Returns

An iterator pointing to the element pointed to by `__last` prior to erasing (or `end()`).

This function will erase the elements in the range `[__first,__last)` and shorten the vector accordingly.

Note This operation could be expensive and if it is frequently used the user should consider using `std::list`. The user is also cautioned that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1172 of file `stl_vector.h`.

4.965.3.25 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> reference std::vector< _Tp, _Alloc >::front ( ) [inline], [noexcept]`

Returns a read/write reference to the data at the first element of the vector.

Definition at line 851 of file `stl_vector.h`.

Referenced by `std::piecewise_constant_distribution< _RealType >::min()`, and `std::piecewise_linear_distribution< _RealType >::min()`.

4.965.3.26 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reference std::vector< _Tp, _Alloc >::front ( ) const [inline], [noexcept]`

Returns a read-only (constant) reference to the data at the first element of the vector.

Definition at line 859 of file `stl_vector.h`.

4.965.3.27 `template<typename _Tp, typename _Alloc > vector< _Tp, _Alloc >::iterator vector::insert ( const_iterator __position, const value_type & __x )`

Inserts given value into vector before specified iterator.

#### Parameters

|                         |                                                |
|-------------------------|------------------------------------------------|
| <code>__position</code> | A <code>const_iterator</code> into the vector. |
| <code>__x</code>        | Data to be inserted.                           |

#### Returns

An iterator that points to the inserted data.

This function will insert a copy of the given value before the specified location. Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using `std::list`.

Definition at line 109 of file `vector.tcc`.

References `std::begin()`, and `std::end()`.

Referenced by `std::vector< block_type, allocator_type >::insert()`, and `std::vector< block_type, allocator_type >::resize()`.

4.965.3.28 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::vector< _Tp, _Alloc >::insert ( const_iterator __position, value_type && __x ) [inline]`

Inserts given rvalue into vector before specified iterator.

#### Parameters

|                         |                                                |
|-------------------------|------------------------------------------------|
| <code>__position</code> | A <code>const_iterator</code> into the vector. |
| <code>__x</code>        | Data to be inserted.                           |

#### Returns

An iterator that points to the inserted data.

This function will insert a copy of the given rvalue before the specified location. Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using `std::list`.

Definition at line 1014 of file `stl_vector.h`.

4.965.3.29 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::vector< _Tp, _Alloc >::insert ( const_iterator __position, initializer_list< value_type > __l ) [inline]`

Inserts an `initializer_list` into the vector.

## Parameters

|                         |                              |
|-------------------------|------------------------------|
| <code>__position</code> | An iterator into the vector. |
| <code>__l</code>        | An initializer_list.         |

This function will insert copies of the data in the initializer\_list *l* into the vector before the location specified by *position*.

Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using `std::list`.

Definition at line 1031 of file `stl_vector.h`.

4.965.3.30 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::vector< _Tp, _Alloc >::insert ( const_iterator __position, size_type __n, const value_type & __x ) [inline]`

Inserts a number of copies of given data into the vector.

## Parameters

|                         |                                    |
|-------------------------|------------------------------------|
| <code>__position</code> | A const_iterator into the vector.  |
| <code>__n</code>        | Number of elements to be inserted. |
| <code>__x</code>        | Data to be inserted.               |

## Returns

An iterator that points to the inserted data.

This function will insert a specified number of copies of the given data before the location specified by *position*.

Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using `std::list`.

Definition at line 1051 of file `stl_vector.h`.

4.965.3.31 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> template<typename _InputIterator, typename = std::RequireInputIter<_InputIterator>> iterator std::vector< _Tp, _Alloc >::insert ( const_iterator __position, _InputIterator __first, _InputIterator __last ) [inline]`

Inserts a range into the vector.

## Parameters

|                         |                                   |
|-------------------------|-----------------------------------|
| <code>__position</code> | A const_iterator into the vector. |
| <code>__first</code>    | An input iterator.                |
| <code>__last</code>     | An input iterator.                |

## Returns

An iterator that points to the inserted data.

This function will insert copies of the data in the range [`__first`,`__last`) into the vector before the location specified by *pos*.

Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using `std::list`.

Definition at line 1095 of file `stl_vector.h`.

4.965.3.32 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> size_type std::vector< _Tp, _Alloc >::max_size ( ) const [inline], [noexcept]`

Returns the `size()` of the largest possible vector.

Definition at line 659 of file `stl_vector.h`.

**4.965.3.33** `template<typename _Tp, typename _Alloc> vector<_Tp, _Alloc> & vector::operator= ( const vector<_Tp, _Alloc> & __x )`

Vector assignment operator.

#### Parameters

|                  |                                                    |
|------------------|----------------------------------------------------|
| <code>__x</code> | A vector of identical element and allocator types. |
|------------------|----------------------------------------------------|

All the elements of `__x` are copied, but any extra memory in `__x` (for fast expansion) will not be copied. Unlike the copy constructor, the allocator object is not copied.

Definition at line 165 of file `vector.tcc`.

References `std::_Destroy()`, `std::begin()`, `std::vector<_Tp, _Alloc>::begin()`, `std::end()`, `std::vector<_Tp, _Alloc>::end()`, `std::vector<_Tp, _Alloc>::size()`, and `std::size()`.

**4.965.3.34** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> vector& std::vector<_Tp, _Alloc>::operator= ( vector<_Tp, _Alloc> && __x ) [inline], [noexcept]`

Vector move assignment operator.

#### Parameters

|                  |                                                    |
|------------------|----------------------------------------------------|
| <code>__x</code> | A vector of identical element and allocator types. |
|------------------|----------------------------------------------------|

The contents of `__x` are moved into this vector (without copying, if the allocators permit it). `__x` is a valid, but unspecified vector.

Definition at line 448 of file `stl_vector.h`.

**4.965.3.35** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> vector& std::vector<_Tp, _Alloc>::operator= ( initializer_list<value_type> __l ) [inline]`

Vector list assignment operator.

#### Parameters

|                  |                                    |
|------------------|------------------------------------|
| <code>__l</code> | An <code>initializer_list</code> . |
|------------------|------------------------------------|

This function fills a vector with copies of the elements in the initializer list `__l`.

Note that the assignment completely changes the vector and that the resulting vector's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 470 of file `stl_vector.h`.

**4.965.3.36** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> reference std::vector<_Tp, _Alloc>::operator[] ( size_type __n ) [inline], [noexcept]`

Subscript access to the data contained in the vector.

#### Parameters

|                  |                                                             |
|------------------|-------------------------------------------------------------|
| <code>__n</code> | The index of the element for which data should be accessed. |
|------------------|-------------------------------------------------------------|

#### Returns

Read/write reference to data.

This operator allows for easy, array-style, data access. Note that data access with this operator is unchecked and `out_of_range` lookups are not defined. (For checked lookups see `at()`.)

Definition at line 779 of file stl\_vector.h.

```
4.965.3.37 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reference std::vector< _Tp, _Alloc
>::operator[](size_type __n) const [inline], [noexcept]
```

Subscript access to the data contained in the vector.

#### Parameters

|                  |                                                             |
|------------------|-------------------------------------------------------------|
| <code>__n</code> | The index of the element for which data should be accessed. |
|------------------|-------------------------------------------------------------|

#### Returns

Read-only (constant) reference to data.

This operator allows for easy, array-style, data access. Note that data access with this operator is unchecked and out\_of\_range lookups are not defined. (For checked lookups see at().)

Definition at line 794 of file stl\_vector.h.

```
4.965.3.38 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::vector< _Tp, _Alloc >::pop_back ()
[inline], [noexcept]
```

Removes last element.

This is a typical stack operation. It shrinks the vector by one.

Note that no data is returned, and if the last element's data is needed, it should be retrieved before pop\_back() is called.

Definition at line 949 of file stl\_vector.h.

```
4.965.3.39 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::vector< _Tp, _Alloc >::push_back (
const value_type & __x) [inline]
```

Add data to the end of the vector.

#### Parameters

|                  |                   |
|------------------|-------------------|
| <code>__x</code> | Data to be added. |
|------------------|-------------------|

This is a typical stack operation. The function creates an element at the end of the vector and assigns the given data to it. Due to the nature of a vector this operation can be done in constant time if the vector has preallocated space available.

Definition at line 913 of file stl\_vector.h.

Referenced by `__gnu_parallel::multiseq_partition()`, and `__gnu_parallel::multiseq_selection()`.

```
4.965.3.40 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> reverse_iterator std::vector< _Tp, _Alloc
>::rbegin () [inline], [noexcept]
```

Returns a read/write reverse iterator that points to the last element in the vector. Iteration is done in reverse element order.

Definition at line 583 of file stl\_vector.h.

```
4.965.3.41 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reverse_iterator std::vector< _Tp,
_Alloc >::rbegin () const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last element in the vector. Iteration is done in reverse element order.

Definition at line 592 of file stl\_vector.h.

4.965.3.42 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> reverse_iterator std::vector<_Tp, _Alloc>::rend ( ) [inline], [noexcept]`

Returns a read/write reverse iterator that points to one before the first element in the vector. Iteration is done in reverse element order.

Definition at line 601 of file `stl_vector.h`.

4.965.3.43 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reverse_iterator std::vector<_Tp, _Alloc>::rend ( ) const [inline], [noexcept]`

Returns a read-only (constant) reverse iterator that points to one before the first element in the vector. Iteration is done in reverse element order.

Definition at line 610 of file `stl_vector.h`.

4.965.3.44 `template<typename _Tp, typename _Alloc> void vector::reserve ( size_type __n )`

Attempt to preallocate enough memory for specified number of elements.

#### Parameters

|                  |                              |
|------------------|------------------------------|
| <code>__n</code> | Number of elements required. |
|------------------|------------------------------|

#### Exceptions

|                                |                                                     |
|--------------------------------|-----------------------------------------------------|
| <code>std::length_error</code> | If <code>n</code> exceeds <code>max_size()</code> . |
|--------------------------------|-----------------------------------------------------|

This function attempts to reserve enough memory for the vector to hold the specified number of elements. If the number requested is more than `max_size()`, `length_error` is thrown.

The advantage of this function is that if optimal code is a necessity and the user can determine the number of elements that will be required, the user can reserve the memory in advance, and thus prevent a possible reallocation of memory and copying of vector data.

4.965.3.45 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::vector<_Tp, _Alloc>::resize ( size_type __new_size ) [inline]`

Resizes the vector to the specified number of elements.

#### Parameters

|                         |                                               |
|-------------------------|-----------------------------------------------|
| <code>__new_size</code> | Number of elements the vector should contain. |
|-------------------------|-----------------------------------------------|

This function will resize the vector to the specified number of elements. If the number is smaller than the vector's current size the vector is truncated, otherwise default constructed elements are appended.

Definition at line 673 of file `stl_vector.h`.

Referenced by `__gnu_parallel::__shrink_and_double()`, and `__gnu_parallel::multiway_merge_exact_splitting()`.

4.965.3.46 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::vector<_Tp, _Alloc>::resize ( size_type __new_size, const value_type & __x ) [inline]`

Resizes the vector to the specified number of elements.

## Parameters

|                         |                                                   |
|-------------------------|---------------------------------------------------|
| <code>__new_size</code> | Number of elements the vector should contain.     |
| <code>__x</code>        | Data with which new elements should be populated. |

This function will resize the vector to the specified number of elements. If the number is smaller than the vector's current size the vector is truncated, otherwise the vector is extended and new elements are populated with given data.

Definition at line 693 of file `stl_vector.h`.

4.965.3.47 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::vector< _Tp, _Alloc >::shrink_to_fit ( ) [inline]`

A non-binding request to reduce capacity() to size().

Definition at line 725 of file `stl_vector.h`.

4.965.3.48 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> size_type std::vector< _Tp, _Alloc >::size ( ) const [inline], [noexcept]`

Returns the number of elements in the vector.

Definition at line 654 of file `stl_vector.h`.

Referenced by `__gnu_parallel::__shrink()`, `__gnu_parallel::__shrink_and_double()`, `std::vector< block_type, allocator_type >::_M_range_check()`, `__gnu_parallel::list_partition()`, `std::discrete_distribution< _IntType >::max()`, `std::vector< _Tp, _Alloc >::operator=()`, `std::operator==()`, `std::vector< block_type, allocator_type >::resize()`, and `std::regex_traits< _Ch_type >::transform_primary()`.

4.965.3.49 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::vector< _Tp, _Alloc >::swap ( vector< _Tp, _Alloc > &__x ) [inline], [noexcept]`

Swaps data with another vector.

## Parameters

|                  |                                                   |
|------------------|---------------------------------------------------|
| <code>__x</code> | A vector of the same element and allocator types. |
|------------------|---------------------------------------------------|

This exchanges the elements between two vectors in constant time. (Three pointers, so it should be quite fast.) Note that the global `std::swap()` function is specialized such that `std::swap(v1,v2)` will feed to this function.

Definition at line 1188 of file `stl_vector.h`.

#### 4.966.1 Detailed Description

template<typename \_Alloc>class std::vector< bool, \_Alloc >

A specialization of vector for booleans which offers fixed time access to individual elements in any order.

#### Template Parameters

---

|                     |                 |
|---------------------|-----------------|
| <code>_Alloc</code> | Allocator type. |
|---------------------|-----------------|

Note that `vector<bool>` does not actually meet the requirements for being a container. This is because the reference and pointer types are not really references and pointers to `bool`. See DR96 for details.

#### See Also

`vector` for function documentation.

In some terminology a vector can be described as a dynamic C-style array, it offers fast and efficient access to individual elements in any order and saves the user from worrying about memory and size allocation. Subscripting ( `[]` ) access is also provided as with C-style arrays.

### 5.1.1 Detailed Description

Parallel STL function calls corresponding to the `stl_algo.h` header. The functions defined here mainly do case switches and call the actual parallelized versions in other files. Inlining policy: Functions that basically only contain one function call, are declared inline. This file is a GNU parallel extension to the Standard C++ Library.

### 5.22.1 Detailed Description

Implementation of a dynamically load-balanced parallel quicksort. It works in-place and needs only logarithmic extra memory. The algorithm is similar to the one proposed in

P. Tsigas and Y. Zhang. A simple, fast parallel implementation of quicksort and its performance evaluation on SUN enterprise 10000. In 11th Euromicro Conference on Parallel, Distributed and Network-Based Processing, page 372, 2003.

### 5.80.2 Macro Definition Documentation

#### 5.80.2.1 `#define _GLIBCXX_ASSERTIONS`

Switch on many `_GLIBCXX_PARALLEL_ASSERTIONS` in parallel code. Should be switched on only locally.

Definition at line 61 of file `compiletime_settings.h`.

Referenced by `__gnu_parallel::__qsb_local_sort_with_helping()`.

#### 5.80.2.2 `#define _GLIBCXX_CALL( __n )`

Macro to produce log message when entering a function.

Parameters

|                  |             |
|------------------|-------------|
| <code>__n</code> | Input size. |
|------------------|-------------|

#### 5.80.2.3 `#define _GLIBCXX_RANDOM_SHUFFLE_CONSIDER_L1`

Switch on many `_GLIBCXX_PARALLEL_ASSERTIONS` in parallel code. Consider the size of the L1 cache for `gnu_parallel::__parallel_random_shuffle()`.

Definition at line 68 of file `compiletime_settings.h`.

#### 5.80.2.4 `#define _GLIBCXX_RANDOM_SHUFFLE_CONSIDER_TLB`

Switch on many `_GLIBCXX_PARALLEL_ASSERTIONS` in parallel code. Consider the size of the TLB for `gnu_parallel::__parallel_random_shuffle()`.

Definition at line 74 of file `compiletime_settings.h`.

5.80.2.5 `#define _GLIBCXX_SCALE_DOWN_FPU`

Use floating-point scaling instead of modulo for mapping random numbers to a range. This can be faster on certain CPUs.

Definition at line 55 of file `comptime_settings.h`.

5.80.2.6 `#define _GLIBCXX_VERBOSE_LEVEL`

Determine verbosity level of the parallel mode. Level 1 prints a message each time a parallel-mode function is entered.

Definition at line 37 of file `comptime_settings.h`.

This file is a GNU extension to the Standard C++ Library.

Definition in file [debug\\_allocator.h](#).

### 5.143 `debug_fn_imps.hpp` File Reference

#### 5.143.1 Detailed Description

Contains an implementation class for a `binary_heap`.

Definition in file [binary\\_heap\\_/debug\\_fn\\_imps.hpp](#).

### 5.144 `debug_fn_imps.hpp` File Reference

#### 5.144.1 Detailed Description

Contains an implementation for `binomial_heap_`.

Definition in file [binomial\\_heap\\_/debug\\_fn\\_imps.hpp](#).

### 5.145 `debug_fn_imps.hpp` File Reference

#### 5.145.1 Detailed Description

Contains an implementation class for a base of binomial heaps.

Definition in file [binomial\\_heap\\_base\\_/debug\\_fn\\_imps.hpp](#).

### 5.146 `debug_fn_imps.hpp` File Reference

#### 5.146.1 Detailed Description

Contains an implementation class for `bin_search_tree_`.

Definition in file [bin\\_search\\_tree\\_/debug\\_fn\\_imps.hpp](#).

### 5.147 `debug_fn_imps.hpp` File Reference

#### 5.147.1 Detailed Description

Contains implementations of `cc_ht_map_`'s debug-mode functions.

Definition in file [cc\\_hash\\_table\\_map\\_/debug\\_fn\\_imps.hpp](#).

### 5.148 `debug_fn_imps.hpp` File Reference

#### 5.148.1 Detailed Description

Contains implementations of `gp_ht_map_`'s debug-mode functions.

Definition in file [gp\\_hash\\_table\\_map\\_/debug\\_fn\\_imps.hpp](#).

### 5.149 `debug_fn_imps.hpp` File Reference

#### 5.149.1 Detailed Description

Contains an implementation class for `left_child_next_sibling_heap_`.

Definition in file [left\\_child\\_next\\_sibling\\_heap\\_/debug\\_fn\\_imps.hpp](#).

### 5.150 `debug_fn_imps.hpp` File Reference

#### 5.150.1 Detailed Description

Contains implementations of `cc_ht_map_`'s debug-mode functions.

Definition in file [list\\_update\\_map\\_/debug\\_fn\\_imps.hpp](#).

### 5.151 `debug_fn_imps.hpp` File Reference

#### 5.151.1 Detailed Description

Contains an implementation class for `ov_tree_`.

Definition in file [ov\\_tree\\_map\\_/debug\\_fn\\_imps.hpp](#).

### 5.152 `debug_fn_imps.hpp` File Reference

#### 5.152.1 Detailed Description

Contains an implementation class for a pairing heap.

Definition in file [pairing\\_heap\\_/debug\\_fn\\_imps.hpp](#).

### 5.153 `debug_fn_imps.hpp` File Reference

#### 5.153.1 Detailed Description

Contains an implementation class for `pat_trie_`.

Definition in file [pat\\_trie\\_/debug\\_fn\\_imps.hpp](#).

### 5.154 `debug_fn_imps.hpp` File Reference

#### 5.154.1 Detailed Description

Contains an implementation for `rb_tree_`.

Definition in file [rb\\_tree\\_map\\_/debug\\_fn\\_imps.hpp](#).

### 5.155 `debug_fn_imps.hpp` File Reference

#### 5.155.1 Detailed Description

Contains an implementation for `rc_binomial_heap_`.

Definition in file [rc\\_binomial\\_heap\\_/debug\\_fn\\_imps.hpp](#).

### 5.156 [debug\\_fn\\_imps.hpp](#) File Reference

#### 5.156.1 Detailed Description

Contains an implementation class for `splay_tree_`.

Definition in file [splay\\_tree\\_/debug\\_fn\\_imps.hpp](#).

### 5.157 [debug\\_fn\\_imps.hpp](#) File Reference

#### 5.157.1 Detailed Description

Contains an implementation for `thin_heap_`.

Definition in file [thin\\_heap\\_/debug\\_fn\\_imps.hpp](#).

### 5.158 [debug\\_map\\_base.hpp](#) File Reference

#### 5.158.1 Detailed Description

Contains a debug-mode base for all maps.

Definition in file [debug\\_map\\_base.hpp](#).

### 5.159 [debug\\_no\\_store\\_hash\\_fn\\_imps.hpp](#) File Reference

#### 5.159.1 Detailed Description

Contains implementations of `cc_ht_map_`'s debug-mode functions.

Definition in file [cc\\_hash\\_table\\_map\\_/debug\\_no\\_store\\_hash\\_fn\\_imps.hpp](#).

### 5.160 [debug\\_no\\_store\\_hash\\_fn\\_imps.hpp](#) File Reference

#### 5.160.1 Detailed Description

Contains implementations of `gp_ht_map_`'s debug-mode functions.

Definition in file [gp\\_hash\\_table\\_map\\_/debug\\_no\\_store\\_hash\\_fn\\_imps.hpp](#).

### 5.161 [debug\\_store\\_hash\\_fn\\_imps.hpp](#) File Reference

#### 5.161.1 Detailed Description

Contains implementations of `cc_ht_map_`'s debug-mode functions.

Definition in file [cc\\_hash\\_table\\_map\\_/debug\\_store\\_hash\\_fn\\_imps.hpp](#).

## 5.162 debug\_store\_hash\_fn\_imps.hpp File Reference

### 5.162.1 Detailed Description

Contains implementations of `gp_ht_map_`'s debug-mode functions.

The `<iostream>` header declares the eight standard stream objects. For other declarations, see <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt11ch24.html> and the [I/O forward declarations](#)

They are required by default to cooperate with the global C library's `FILE` streams, and to be available during program startup and termination. For more information, see the [HOWTO](#) linked to above.

### 5.326.1 Detailed Description

This file is a GNU debug extension to the Standard C++ Library.

Definition in file [macros.h](#).

### 5.326.2 Macro Definition Documentation

#### 5.326.2.1 `#define __glibcxx_check_erase( _Position )`

Verify that we can erase the element referenced by the iterator `_Position`. We can erase the element if the `_Position` iterator is dereferenceable and references this sequence.

Definition at line 139 of file [macros.h](#).

#### 5.326.2.2 `#define __glibcxx_check_erase_after( _Position )`

Verify that we can erase the element after the iterator `_Position`. We can erase the element if the `_Position` iterator is before a dereferenceable one and references this sequence.

Definition at line 153 of file [macros.h](#).

### 5.326.2.3 `#define __glibcxx_check_erase_range( _First, _Last )`

Verify that we can erase the elements in the iterator range `[_First, _Last)`. We can erase the elements if `[_First, _Last)` is a valid iterator range within this sequence.

Definition at line 167 of file `macros.h`.

### 5.326.2.4 `#define __glibcxx_check_erase_range_after( _First, _Last )`

Verify that we can erase the elements in the iterator range `(_First, _Last)`. We can erase the elements if `(_First, _Last)` is a valid iterator range within this sequence.

Definition at line 179 of file `macros.h`.

### 5.326.2.5 `#define __glibcxx_check_heap_pred( _First, _Last, _Pred )`

Verify that the iterator range `[_First, _Last)` is a heap w.r.t. the predicate `_Pred`.

Definition at line 329 of file `macros.h`.

### 5.326.2.6 `#define __glibcxx_check_insert( _Position )`

Verify that we can insert into `*this` with the iterator `_Position`. Insertion into a container at a specific position requires that the iterator be nonsingular, either dereferenceable or past-the-end, and that it reference the sequence we are inserting into. Note that this macro is only valid when the container is a `_Safe_sequence` and the iterator is a `_Safe_iterator`.

Definition at line 73 of file `macros.h`.

### 5.326.2.7 `#define __glibcxx_check_insert_after( _Position )`

Verify that we can insert into `*this` after the iterator `_Position`. Insertion into a container after a specific position requires that the iterator be nonsingular, either dereferenceable or before-begin, and that it reference the sequence we are inserting into. Note that this macro is only valid when the container is a `_Safe_sequence` and the iterator is a `_Safe_iterator`.

Definition at line 90 of file `macros.h`.

### 5.326.2.8 `#define __glibcxx_check_insert_range( _Position, _First, _Last )`

Verify that we can insert the values in the iterator range `[_First, _Last)` into `*this` with the iterator `_Position`. Insertion into a container at a specific position requires that the iterator be nonsingular (i.e., either dereferenceable or past-the-end), that it reference the sequence we are inserting into, and that the iterator range `[_First, _Last)` is a valid (possibly empty) range which does not reference the sequence we are inserting into. Note that this macro is only valid when the container is a `_Safe_sequence` and the `_Position` iterator is a `_Safe_iterator`.

Definition at line 107 of file `macros.h`.

### 5.326.2.9 `#define __glibcxx_check_insert_range_after( _Position, _First, _Last )`

Verify that we can insert the values in the iterator range `[_First, _Last)` into `*this` after the iterator `_Position`. Insertion into a container after a specific position requires that the iterator be nonsingular (i.e., either dereferenceable or past-the-end), that it reference the sequence we are inserting into, and that the iterator range `[_First, _Last)` is a valid (possibly empty) range which does not reference the sequence we are inserting into. Note that this macro is only valid when the container is a `_Safe_sequence` and the `_Position` iterator is a `_Safe_iterator`.

Definition at line 126 of file `macros.h`.

### 5.326.2.10 `#define __glibcxx_check_partitioned_lower( _First, _Last, _Value )`

Verify that the iterator range `[_First, _Last)` is partitioned w.r.t. the value `_Value`.

Definition at line 273 of file `macros.h`.

5.326.2.11 `#define __glibcxx_check_partitioned_lower_pred( _First, _Last, _Value, _Pred )`

Verify that the iterator range `[_First, _Last)` is partitioned w.r.t. the value `_Value` and predicate `_Pred`.

Definition at line 295 of file `macros.h`.

5.326.2.12 `#define __glibcxx_check_partitioned_upper_pred( _First, _Last, _Value, _Pred )`

Verify that the iterator range `[_First, _Last)` is partitioned w.r.t. the value `_Value` and predicate `_Pred`.

Definition at line 308 of file `macros.h`.

5.326.2.13 `#define __glibcxx_check_sorted_pred( _First, _Last, _Pred )`

Verify that the iterator range `[_First, _Last)` is sorted by the predicate `_Pred`.

Definition at line 239 of file `macros.h`.

5.326.2.14 `#define _GLIBCXX_DEBUG_VERIFY_AT( _Condition, _ErrorMessage, _File, _Line )`

Macros used by the implementation to verify certain properties. These macros may only be used directly by the debug wrappers. Note that these are macros (instead of the more obviously *correct* choice of making them functions) because we need line and file information at the call site, to minimize the distance between the user error and where the error is reported.

Definition at line 41 of file `macros.h`.

## 5.352.2 Function Documentation

## 5.352.2.1 void operator delete ( void \* ) [noexcept]

These are replaceable signatures:

- normal single new and delete (no arguments, throw `bad_alloc` on error)
- normal array new and delete (same)
- `nothrow` single new and delete (take a `nothrow` argument, return `NULL` on error)
- `nothrow` array new and delete (same)

Placement new and delete signatures (take a memory address argument, does nothing) may not be replaced by a user's program.

### 5.352.2.2 `void operator delete ( void *, const std::nothrow_t & ) [nothrow]`

These are replaceable signatures:

- normal single new and delete (no arguments, throw `bad_alloc` on error)
- normal array new and delete (same)
- `nothrow` single new and delete (take a `nothrow` argument, return `NULL` on error)
- `nothrow` array new and delete (same)

Placement new and delete signatures (take a memory address argument, does nothing) may not be replaced by a user's program.

### 5.352.2.3 `void operator delete ( void *, void * ) [inline], [nothrow]`

These are replaceable signatures:

- normal single new and delete (no arguments, throw `bad_alloc` on error)
- normal array new and delete (same)
- `nothrow` single new and delete (take a `nothrow` argument, return `NULL` on error)
- `nothrow` array new and delete (same)

Placement new and delete signatures (take a memory address argument, does nothing) may not be replaced by a user's program.

Definition at line 152 of file new.

### 5.352.2.4 `void operator delete[] ( void * ) [nothrow]`

These are replaceable signatures:

- normal single new and delete (no arguments, throw `bad_alloc` on error)
- normal array new and delete (same)
- `nothrow` single new and delete (take a `nothrow` argument, return `NULL` on error)
- `nothrow` array new and delete (same)

Placement new and delete signatures (take a memory address argument, does nothing) may not be replaced by a user's program.

### 5.352.2.5 `void operator delete[] ( void *, const std::nothrow_t & ) [nothrow]`

These are replaceable signatures:

- normal single new and delete (no arguments, throw `bad_alloc` on error)
- normal array new and delete (same)
- `nothrow` single new and delete (take a `nothrow` argument, return `NULL` on error)
- `nothrow` array new and delete (same)

Placement new and delete signatures (take a memory address argument, does nothing) may not be replaced by a user's program.

**5.352.2.6** `void operator delete[] ( void *, void * ) [inline], [nothrow]`

These are replaceable signatures:

- normal single new and delete (no arguments, throw `bad_alloc` on error)
- normal array new and delete (same)
- `nothrow` single new and delete (take a `nothrow` argument, return `NULL` on error)
- `nothrow` array new and delete (same)

Placement new and delete signatures (take a memory address argument, does nothing) may not be replaced by a user's program.

Definition at line 153 of file `new`.

**5.352.2.7** `void* operator new ( std::size_t )`

These are replaceable signatures:

- normal single new and delete (no arguments, throw `bad_alloc` on error)
- normal array new and delete (same)
- `nothrow` single new and delete (take a `nothrow` argument, return `NULL` on error)
- `nothrow` array new and delete (same)

Placement new and delete signatures (take a memory address argument, does nothing) may not be replaced by a user's program.

**5.352.2.8** `void* operator new ( std::size_t, const std::nothrow_t & ) [nothrow]`

These are replaceable signatures:

- normal single new and delete (no arguments, throw `bad_alloc` on error)
- normal array new and delete (same)
- `nothrow` single new and delete (take a `nothrow` argument, return `NULL` on error)
- `nothrow` array new and delete (same)

Placement new and delete signatures (take a memory address argument, does nothing) may not be replaced by a user's program.

**5.352.2.9** `void* operator new ( std::size_t, void * __p ) [inline], [nothrow]`

These are replaceable signatures:

- normal single new and delete (no arguments, throw `bad_alloc` on error)
- normal array new and delete (same)
- `nothrow` single new and delete (take a `nothrow` argument, return `NULL` on error)
- `nothrow` array new and delete (same)

Placement new and delete signatures (take a memory address argument, does nothing) may not be replaced by a user's program.

Definition at line 146 of file `new`.

#### 5.352.2.10 `void* operator new[]( std::size_t )`

These are replaceable signatures:

- normal single new and delete (no arguments, throw `bad_alloc` on error)
- normal array new and delete (same)
- `nothrow` single new and delete (take a `nothrow` argument, return `NULL` on error)
- `nothrow` array new and delete (same)

Placement new and delete signatures (take a memory address argument, does nothing) may not be replaced by a user's program.

#### 5.352.2.11 `void* operator new[]( std::size_t, const std::nothrow_t & ) [nothrow]`

These are replaceable signatures:

- normal single new and delete (no arguments, throw `bad_alloc` on error)
- normal array new and delete (same)
- `nothrow` single new and delete (take a `nothrow` argument, return `NULL` on error)
- `nothrow` array new and delete (same)

Placement new and delete signatures (take a memory address argument, does nothing) may not be replaced by a user's program.

#### 5.352.2.12 `void* operator new[]( std::size_t, void *__p ) [inline], [nothrow]`

These are replaceable signatures:

- normal single new and delete (no arguments, throw `bad_alloc` on error)
- normal array new and delete (same)
- `nothrow` single new and delete (take a `nothrow` argument, return `NULL` on error)
- `nothrow` array new and delete (same)

Placement new and delete signatures (take a memory address argument, does nothing) may not be replaced by a user's program.

### 5.364.1 Detailed Description

Parallel STL function calls corresponding to `stl_numeric.h`. The functions defined here mainly do case switches and call the actual parallelized versions in other files. Inlining policy: Functions that basically only contain one function call, are declared inline. This file is a GNU parallel extension to the Standard C++ Library.

Definition in file [parallel/numeric](#).

## 5.407.1 Detailed Description

Algorithms used by the profile extension. This file is needed to avoid including `<algorithm>` or `<bits/stl_algo.h>`. Including those files would result in recursive includes. These implementations are oversimplified. In general, efficiency may be sacrificed to minimize maintenance overhead.

### Macros

- `#define \_GLIBCXX\_PARALLEL\_CONDITION(__c)`

### 5.495.1 Detailed Description

Runtime settings and tuning parameters, heuristics to decide whether to use parallelized algorithms. This file is a GNU parallel extension to the Standard C++ Library.

## 5.495.2 parallelization\_decision

The decision whether to run an algorithm in parallel.

There are several ways the user can switch on and \_\_\_off the parallel execution of an algorithm, both at compile- and run-time.

Only sequential execution can be forced at compile-time. This reduces code size and protects code parts that have non-thread-safe side effects.

Ultimately, forcing parallel execution at compile-time makes sense. Often, the sequential algorithm implementation is used as a subroutine, so no reduction in code size can be achieved. Also, the machine the program is run on might have only one processor core, so to avoid overhead, the algorithm is executed sequentially.

To force sequential execution of an algorithm ultimately at compile-time, the user must add the tag `gnu_parallel::sequential_tag()` to the end of the parameter list, e. g.

```
std::sort(__v.begin(), __v.end(), __gnu_parallel::sequential_tag());
```

This is compatible with all overloaded algorithm variants. No additional code will be instantiated, at all. The same holds for most algorithm calls with iterators not providing random access.

If the algorithm call is not forced to be executed sequentially at compile-time, the decision is made at run-time. The global variable `__gnu_parallel::_Settings::algorithm_strategy` is checked. \_It is a tristate variable corresponding to:

a. `force_sequential`, meaning the sequential algorithm is executed. b. `force_parallel`, meaning the parallel algorithm is executed. c. `heuristic`

For heuristic, the parallel algorithm implementation is called only if the input size is sufficiently large. For most algorithms, the input size is the (combined) length of the input sequence(\_\_s). The threshold can be set by the user, individually for each algorithm. The according variables are called `gnu_parallel::_Settings::[algorithm]_minimal_n`.

For some of the algorithms, there are even more tuning options, e. g. the ability to choose from multiple algorithm variants. See below for details.

Definition in file [settings.h](#).

## 5.495.3 Macro Definition Documentation

## 5.495.3.1 #define GLIBCXX\_PARALLEL\_CONDITION( \_\_c )

Determine at compile(?)-time if the parallel variant of an algorithm should be called.

Parameters

|                  |                                                                                                                                                                       |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>__c</code> | A condition that is convertible to bool that is overruled by <code>__gnu_parallel::_Settings::algorithm_strategy</code> . Usually a decision based on the input size. |

#### 5.528.2 Macro Definition Documentation

##### 5.528.2.1 `#define _GLIBCXX_DEQUE_BUF_SIZE`

This function controls the size of memory nodes.

##### Parameters

|                     |                         |
|---------------------|-------------------------|
| <code>__size</code> | The size of an element. |
|---------------------|-------------------------|

##### Returns

The number (not byte size) of elements per node.

This function started off as a compiler kludge from SGI, but seems to be a useful wrapper around a repeated constant expression. The **512** is tunable (and no other code needs to change), but no investigation has been done since inheriting the SGI code. Touch `_GLIBCXX_DEQUE_BUF_SIZE` only if you know what you are doing, however: changing it breaks the binary compatibility!!

## 5.542.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<utility>`.

Inclusion of this file has been removed from all of the other STL headers for safety reasons, except `std::utility.h`. For more information, see the thread of about twenty messages starting with <http://gcc.gnu.org/ml/libstdc++/2001-01/msg00223.html>, or [http://gcc.gnu.org/onlinedocs/libstdc++/faq.html#faq.ambiguous\\_overloads](http://gcc.gnu.org/onlinedocs/libstdc++/faq.html#faq.ambiguous_overloads)

Short summary: the `rel_ops` operators should be avoided for the present.

### 5.565.1 Detailed Description

This file is a GNU extension to the Standard C++ Library.

Contains two exception-generating types (`throw_value`, `throw_allocator`) intended to be used as value and allocator types while testing exception safety in templated containers and algorithms. The allocator has additional log and debug features. The exception generated is of type `forced_exception_error`.

5.622.1 Detailed Description

Parallelization of embarrassingly parallel execution by means of work-stealing. Work stealing is described in

R. D. Blumofe and C. E. Leiserson. Scheduling multithreaded computations by work stealing. *Journal of the ACM*, 46(5):720–748, 1999.

This file is a GNU parallel extension to the Standard C++ Library.

Definition in file [workstealing.h](#).
